

ACTIVATING
KAMPALA
KUNBYGV
VCLIVLINO

Early in the morning, as the sun rises over Kampala, a heavy fog hovers over the city.

This is evidence of the contaminated air within the city. Kampala is ranked among one of the world's most polluted cities.

My younger brother
Vernon (15) suffers from
breathing
complications.

At times, it
gets very
serious that
he needs to
use an
inhaler or be
nebulized in
order to
clear his
lungs.

According to
Kampala City
Council Authority
(KCCA), air
pollution in
Kampala is mostly
caused by dust
from unpaved
roads, fumes from
cars and open
burning of waste.

While moving about the city, I realised just how toxic it was to be living and breathing these fumes everyday.

I started paying attention to things that contribute to air pollution in my city.

28,000 people die
each year in Uganda
as a result of air
pollution.

If you would like to
see data about the
current air quality in
Kampala...
